Ocean Island Liquor Vendor System Enhancement Requirements

1. Executive Summary

CSS will add **Liquor Vendor** as the seventh entity type.

The module will reuse the standard Vendor foundation while keeping liquor-specific pricing, license compliance, and ordering rules separate from existing Food & Beverage Vendor workflows.

The initial release includes:

- A 30-day persistent login for Liquor Vendor users;
- English and Simplified Chinese ordering experiences;
- Vendor-level product category management;
- Client price tiers, with Tier A serving as the default and fallback;
- Bulk client and product import;
- A simplified order submission flow;
- Dynamic order pricing until delivery;
- Liquor license upload, manual review, expiration reminders, and ordering restrictions.

2. Scope

2.1 In Scope

The initial release includes:

- A reusable Liquor Vendor entity and related permissions;
- Product category management under Vendor Settings;
- English and Simplified Chinese category labels;
- Secure 30-day persistent sessions;
- Simplified Chinese localization for the core ordering flow;
- Price-tier setup and client assignment;
- Tier A default and fallback pricing;
- Product pricing and availability by tier;
- Client and product import without export;
- Liquor Vendor order review, submission, and confirmation;
- Automatic price updates for orders that have not reached Delivered status;

- License records, manual verification, document retention, expiration reminders, order blocking, and License Hold;
- License-related notifications and audit records.

2.2 Out of Scope for the Initial Release

The following items are not included in the initial release:

- Spanish localization;
- Client or product export;
- Price-change history or a pricing audit-log interface;
- A dedicated license compliance dashboard or report export;
- Automatic approval of a license solely based on OCR results;
- Administrative override of license restrictions;
- Government or third-party license verification integration;
- Direct-to-consumer alcohol sales;
- Consumer age verification;
- Alcohol-specific tax changes;
- Alcohol delivery-route compliance rules;
- Shared Settings libraries for Shipped By and Payment Method.

3. Liquor Vendor Entity and Permissions

3.1 Entity Model

Add **Liquor Vendor** as the seventh CSS entity type.

The entity must inherit standard Vendor functions, including:

- Product catalog management;
- Client management;
- Order processing;
- Invoice and statement management;
- Team and user management;
- Notifications.

Liquor-specific logic must not change the behavior of existing Food & Beverage Vendors.

3.2 Liquor-Specific Permissions

Authorized Liquor Vendor users may be allowed to:

- Manage price tiers and tier-based product prices;
- Assign client price tiers;

- Manage product categories;
- View and edit client license information;
- Upload and review license documents;
- Approve or reject a license;
- Request updated license information;
- View license review history.

License approval and rejection permissions must be limited to authorized Vendor roles.

3.3 Product Category Management

Product categories must be managed through a shared category library under **Vendor Settings**.

Authorized users must be able to:

- Create and edit categories;
- Activate and deactivate categories;
- Store English and Simplified Chinese category names;
- Select an existing category when creating or editing a product;
- View whether a category is currently assigned to any products.

A category assigned to one or more products must not be permanently deleted.

The vendor may deactivate the category to prevent it from being assigned to new products. Existing products assigned to the category must remain unchanged.

4. Persistent Login Session

Liquor Vendor users must remain signed in for up to 30 days unless:

- The user manually logs out;
- The user resets or changes the password;
- The account is disabled;
- An administrator revokes the session;
- A security event requires reauthentication;
- The 30-day session expires.

The session duration should be configurable by entity so the feature can be reused for future Liquor Vendors.

Requirements:

- Closing and reopening the browser must not end a valid session;

- Logout, password reset, account disablement, or administrator revocation must end the session immediately;
- The system should use short-lived access tokens with secure refresh-token rotation;
- Sessions must support server-side revocation;
- Administrators must be able to terminate active sessions.

5. Localization

The initial release must support:

- English;
- Simplified Chinese.

Simplified Chinese may be set as the default ordering language for designated Ocean Island users. English must remain the fallback language.

The following areas must support Simplified Chinese:

- Login and authentication;
- Navigation;
- Product categories;
- Product catalog and product details;
- Search and filters;
- Order review;
- Order submission and confirmation;
- Order history and status;
- Notifications;
- Validation and error messages;
- License status and expiration messages;
- Price and unit labels.

Additional requirements:

- UI translations must be stored in centralized localization files;
- Vendor-entered product information must display in the language entered unless a translated value is provided;
- The system must fall back to English when a Chinese UI translation is unavailable.

6. Client Price Tiers

6.1 Tier Setup and Client Assignment

The vendor must maintain one shared set of client price tiers, such as:

- Tier A;
- Tier B;
- Tier C;
- Tier D.

The number and names of the tiers must be configurable.

Each active client must have one assigned price tier. Clients must not be able to view or change their own tier assignment.

Authorized users must be able to:

- Create and rename tiers;
- Activate and deactivate tiers;
- Reorder tiers;
- Archive unused tiers;
- Assign a tier during client creation;
- Assign a tier during client import;
- Update a tier from the Client Profile;
- Update client tiers in bulk.

When a new or imported client does not have a valid price tier, the system must automatically assign Tier A.

A tier that is currently assigned to clients must not be archived until the affected clients are reassigned.

6.2 Product Pricing and Availability

Each product may have prices for any active tier.

Tier A is required for every active product and serves as the default and fallback price.

The following rules apply:

1. If the product is explicitly unavailable for the client's tier, the product is not orderable.
2. If a price exists for the client's assigned tier, the system uses that price.
3. If the assigned-tier price is missing, the system uses the product's Tier A price.
4. If the Tier A price is missing, the product cannot be published or ordered.

Client Tier	Assigned-Tier Price	Tier A Price	Result

Tier C	Configured	Configured	Use Tier C price
Tier C	Missing	Configured	Use Tier A price
Tier C	Unavailable	Configured	Product is not orderable
Any tier	Missing	Missing	Product cannot be published

This structure allows different products to have different numbers of configured tier prices while maintaining one client-to-tier assignment.

For example:

- Product 1 may have Tier A, Tier B, and Tier C prices;
- Product 2 may have only Tier A and Tier B prices;
- When a Tier C client views Product 2, the system displays the Tier A price because the Tier C price is missing.

6.3 Price Application

- Clients must see only the price and availability applicable to their assigned tier;
- The same pricing rule must apply to product lists, product details, order review, purchase orders, and invoices;
- The client tier assigned when the order is submitted must be stored with the order;
- Changing a client's tier affects future orders but does not change existing orders.

7. Client and Product Import

7.1 Client Import

Authorized users must be able to import clients through a structured CSV or Excel template.

The final template and field mapping must be confirmed with Ocean Island before development is finalized.

Supported fields may include:

- Client ID or customer code;

- Business name;
- Contact information;
- Business address;
- Assigned salesperson;
- Assigned price tier;
- License number;
- License type;
- License effective date;
- License expiration date.

Import rules:

- If the price tier is blank or invalid, assign Tier A;
- License files are not included in the import and must be uploaded manually from the Client Profile;
- Validate required fields, duplicate clients, tier values, and date formats;
- Provide a row-level error report for records that cannot be imported.

7.2 Product and Tier Price Import

Product ID should be the primary matching identifier.

- If the Product ID matches an existing product, update that product;
- If the Product ID is new, create a new product, subject to validation;
- Product name or SKU may not be used as the primary matching key.

Supported fields may include:

- Product ID;
- Product name;
- Category;
- Brand;
- Unit of measure;
- Tier A price;
- Additional tier prices;
- Product status.

The import must validate:

- Duplicate Product IDs;
- Category values;
- Required Tier A prices;
- Tier values;
- Numeric and currency formats.

Client and product export are not included in the initial release.

8. Ordering and Price Locking

8.1 Liquor Vendor Ordering Flow

The Liquor Vendor ordering flow must be:

Product Selection → Order Review → Submit Order → Order Confirmation

Requirements:

- Provide one final review before submission;
- Display products, units, quantities, applicable prices, totals, and notes;
- Do not create or transmit the order until the user completes the final submission;
- Display the order number and confirmation after successful submission;
- Use Order or Purchase Order terminology for the restaurant submission;
- Do not refer to the restaurant submission as an Invoice;
- Do not change the ordering flow for other Vendor types.

8.2 Price Updates Before Delivery

Catalog price changes must update active Liquor Vendor orders until the order reaches **Delivered** status.

This rule applies to:

- Submitted orders that have not been confirmed;
- Confirmed orders that have not been delivered;
- Any other active order that has not reached Delivered status.

When an applicable catalog price changes, the system must:

- Update the corresponding product price on the active order;
- Recalculate the affected line-item total;
- Recalculate the subtotal;
- Recalculate the order total and any other price-dependent amounts;
- Use the client tier stored with the order;
- Apply the Tier A fallback rule when the assigned-tier price is missing;
- Display the updated price and order total to the client before delivery.

The order becomes price-locked when it reaches **Delivered** status.

After delivery:

- Later catalog price changes must not modify the order;
- Later catalog price changes must not modify the final invoice;

- The delivered order and invoice must retain the final price recorded at delivery.

8.3 Ordering Acceptance Criteria

- A client without a valid price tier is assigned Tier A;
- A missing assigned-tier price falls back to Tier A;
- A product marked unavailable for the client's tier cannot be ordered;
- A product without a Tier A price cannot be published or ordered;
- The final order review displays accurate products, quantities, prices, and totals;
- Orders that have not reached Delivered status are repriced correctly when applicable catalog prices change;
- Delivered orders retain the final price recorded at delivery.

9. Customer Liquor License Compliance

9.1 License Record

Each restaurant client must maintain the license required for the applicable alcohol transaction.

The Client Profile must store:

- License holder's legal name;
- Business name;
- License or permit number;
- License type;
- Issuing authority;
- Issuing state or jurisdiction;
- Effective date;
- Expiration date;
- License document;
- Verification status;
- Reviewer;
- Review date;
- Review notes;
- Notification contact information.

License types and jurisdiction-specific requirements must be confirmed by Ocean Island or its legal or compliance representative.

9.2 Verification and Expiration Status

License verification and expiration must be managed as separate statuses.

Status Type	Values	Rule
Verification Status	Not Submitted, Pending Review, Verified, Rejected	Updated by the workflow or an authorized reviewer
Expiration Status	Active, Expiring Soon, Expired, Not Available	Automatically calculated from the expiration date

Rules:

- Uploading a new or replacement license changes the Verification Status to Pending Review;
- Authorized users may verify, reject, or request updated information;
- Users must not manually edit the Expiration Status;
- The system must regularly recalculate the Expiration Status;
- The number of days used for Expiring Soon must be configurable;
- The proposed default is seven days before expiration;
- A license may be Verified and Expiring Soon at the same time.

9.3 Document Upload and Retention

The system must:

- Support PDF, JPG, JPEG, and PNG uploads;
- Use secure file storage and role-based access;
- Apply file-size limits and malware scanning;
- Require license documents to be uploaded manually from the Client Profile;
- Save a renewed license as a new record rather than overwriting the previous record;
- Retain previous license records and documents;
- Allow older records to be marked Replaced or Archived;
- Retain license numbers, dates, statuses, notes, and review history.

Permanent deletion must not be available through the standard user interface in the initial release.

9.4 Manual Verification

The initial release will use manual license verification.

An authorized Ocean Island user must be able to:

- Review the uploaded license document;
- Compare the document with the entered information;
- Approve the license;
- Reject the license;
- Request updated information;
- Add review notes.

Government or third-party license verification integration may be considered as a future enhancement.

9.5 Expiration Reminders

Authorized Liquor Vendor users must be able to configure the following under **Vendor Settings**:

- Whether expiration reminders are enabled;
- Reminder intervals;
- Notification send time;
- Whether to send a reminder on the expiration date;
- Enabled notification channels.

Proposed default reminder intervals:

- 60 days before expiration;
- 30 days before expiration;
- 14 days before expiration;
- 7 days before expiration;
- 1 day before expiration;
- On the expiration date.

The reminder schedule must follow the Liquor Vendor's configured time zone.

Client notification recipients must be configured in the Client Profile. Designated Ocean Island administrators or reviewers may also receive notifications.

Supported channels:

- In-app notification;
- Email;
- SMS, when enabled.

When a license is renewed or replaced, the system must:

- Recalculate the reminder schedule;
- Avoid sending duplicate notifications for the same license, recipient, and reminder interval.

9.6 Ordering Eligibility

A client may place a Liquor Vendor order only when at least one current license is:

- Verified; and
- Active or Expiring Soon.

Expiring Soon

When the license is Expiring Soon, the system must:

- Display a visible warning;
- Display the expiration date or remaining number of days;
- Ask the client to provide an updated license;
- Continue allowing the client to browse products and place orders.

Blocked Ordering

The system must block Liquor Vendor ordering when there is no valid, verified license, including:

- Not Submitted;
- Pending Review without another valid license;
- Rejected;
- Expired.

When ordering is blocked, the system must:

- Disable Add to an order;
- Disable Checkout;
- Disable final Order Submission;
- Explain why the client cannot place an order;
- Instruct the client to contact Ocean Island or submit updated license information.

If a replacement license is Pending Review while the existing verified license remains valid, the client may continue ordering under the existing license.

License restrictions apply only to Liquor Vendor ordering.

Recommended blocked-order message:

> Your liquor license is expired or is not currently valid. Please contact Ocean Island and update your license information before placing an order.

9.7 Existing Orders and License Hold

If a client's license expires after order submission but before full delivery, the order must not be automatically canceled.

The system must place the undelivered portion of the order on **License Hold**.

While the License Hold is active, the system must:

- Keep the order visible to the client and Liquor Vendor;
- Display the reason for the hold;
- Prevent confirmation, shipment, or delivery of undelivered items;
- Ask the client to provide an updated license;
- Notify the appropriate Ocean Island user.

After a renewed license is verified, the system must remove the License Hold and allow the order to continue.

For partially delivered orders:

- Delivered items remain completed and unchanged;
- Undelivered items remain on License Hold.

Fully delivered orders must not be affected by later license expiration.

License expiration must not prevent:

- Returns;
- Credits;
- Refunds for previously delivered orders.

License Hold must be implemented as a compliance flag rather than a new standard Order Status.

9.8 License Acceptance Criteria

- Users can securely upload and review client licenses;
- Verification and expiration statuses update correctly;
- Clients with Expiring Soon licenses receive warnings and may continue ordering;
- Clients without a verified active license cannot place Liquor Vendor orders;
- License renewal updates the current license and reminder schedule without deleting history;
- Undelivered orders enter and exit License Hold correctly.

10. Notifications, Security, and Audit

10.1 Notifications

The initial release includes license-related notifications only:

- A new or replacement license is uploaded and pending review;
- A license is approved;
- A license is rejected;
- Updated license information is requested;
- A license is approaching expiration;
- A license has expired.

Import errors must appear in the import results.

The following events do not require separate notifications in the initial release:

- Product price changes;
- Client tier changes;
- Blocked ordering attempts.

10.2 Access and Audit

The system must:

- Protect license documents, price-tier assignments, product pricing, and internal review notes through role-based access control;
- Prevent a client from accessing another client's license, pricing, or internal notes;
- Record license uploads and replacements;
- Record license status changes;
- Record the reviewer, review date, and reason or notes;
- Record client price-tier assignment changes.

A dedicated price-history log and administrative override workflow are not included in the initial release.

11. Non-Functional Requirements

- **Performance:** Tier pricing and license validation must not materially slow the catalog or checkout experience. Imports must show progress and row-level errors.
- **Reliability:** Failed notifications must be logged and retried. A future external verification-service failure must not allow license restrictions to be bypassed.
- **Scalability:** The design must support multiple Liquor Vendors, vendor-specific tiers, multiple jurisdictions, multiple licenses per client, and additional languages.
- **Usability:** Chinese-speaking users must be able to complete the core ordering flow without relying on English. License warnings must clearly explain the required action.
- **Security:** The system must use secure session management, protected document storage, least-privilege permissions, and server-side enforcement of pricing and license rules.

12. Dependencies and Pending Confirmations

- Ocean Island sample client and product import files;
- Final import field mapping;
- Expected product and client volumes;
- Required license types and jurisdictions;
- Jurisdiction-specific compliance requirements;
- Designated license reviewers;
- Client notification contacts;
- Final reminder intervals;
- Required notification channels;
- Email and SMS service availability;
- Review of Simplified Chinese translations;
- Compatibility with existing CSS authentication, catalog, client, order, invoice, and notification services.

13. Definition of Done

The initial release is complete when:

- Liquor Vendor is available as a reusable seventh entity without changing existing Vendor workflows;
- Authorized users can manage categories, price tiers, clients, products, and imports;
- Tier A default and fallback pricing works across the catalog, orders, purchase orders, and invoices;
- Orders that have not reached Delivered status update after applicable catalog price changes;
- Delivered orders and final invoices retain the price recorded at delivery;
- Ocean Island users can remain logged in for the approved session period;
- The core restaurant ordering flow is available in English and Simplified Chinese;
- License upload, history, review, status calculation, reminders, order blocking, and License Hold work as defined;
- Permissions and license audit records are enforced on the server;
- Security, permission, import, pricing, ordering, notification, and regression testing are complete;
- Ocean Island completes user acceptance testing and approves the release.
